

Knee Joint Aspiration

Joint aspiration is a procedure conducted at Doctor Edges to remove fluid from around a joint using a needle and syringe. It's typically performed under local anesthesia to alleviate swelling and collect fluid for analysis to diagnose joint issues.

Why Might I Need Joint Aspiration?

Joint aspiration provides diagnosis and treatment assistance for various joint disorders such as gout, arthritis, and joint infections. Additionally, it offers relief from pain and improves joint movement by draining excess fluid caused by conditions like bursitis. **Risks of Joint Aspiration:**

- Potential complications include discomfort, bruising, swelling, and infection at the aspiration site.
- Doctor Edges will discuss any specific risks related to your medical condition before the procedure.

Preparing for Joint Aspiration:

Your skilled team at Doctor Edges will explain the procedure and address any concerns you may have. You may need to sign a consent form and disclose any allergies or medications you are taking. Depending on your medical condition, adjustments to your medications may be necessary.

Procedure Steps:

- You'll be provided with a gown and positioned for easy access to the joint.
- The skin will be cleansed, and local anesthesia may be administered.
- An expert physician at Doctor Edges will insert the needle into the joint to extract fluid using a syringe.
- The fluid sample will be sent for examination.

Aftercare Guidelines:

To ensure proper care after the procedure, it is essential to keep the aspiration site clean and dry, adhering to any specific instructions provided by the Doctor Edges team. If there is any soreness or discomfort, use pain relievers as directed. Additionally, it is crucial to report any signs of infection or increased pain to Doctor Edges promptly.

(Doctor Edges will ensure the procedure is conducted safely and provide personalized care throughout, including post-procedure instructions and follow-up care.)
